The Role of the Founder in Creating Organizational Culture

Edgar H. Schein

Minerva, the Roman goddess of wisdom, is said to have sprung full-blown from the forehead of Zeus. Similarly, an organization's culture begins life in the head of its founder, springing from the founder's ideas about truth, reality, and the way the world works.

How do the entrepreneur/founders of organizations create organizational cultures? And how can such cultures be analyzed? These questions are central to this article. First I will examine what organizational culture is, how the founder creates and embeds cultural elements, why it is likely that first-generation companies develop distinctive cultures, and what the implications are in making the transition from founders or owning families to "professional" managers.

The level of confusion over the term organizational culture requires some definitions of terms at the outset. An organizational culture depends for its existence on a definable organization, in the sense of a number of people interacting with each other for the purpose of accomplishing some goal in their defined environment. An organization's founder simultaneously creates such a group and, by force of his or her personality, begins to shape the group's culture. But that new group's culture does not develop until it has overcome various crises.
of growth and survival, and has worked out solutions for coping with its external problems of adaptation and its internal problems of creating a workable set of relationship rules.

Organizational culture, then, is the pattern of basic assumptions that a given group has invented, discovered, or developed in learning to cope with its problems of external adaptation and internal integration—a pattern of assumptions that has worked well enough to be considered valid and, therefore, to be taught to new members as the correct way to perceive, think, and feel in relation to those problems.

In terms of external survival problems, for example, I have heard these kinds of assumptions in first-generation companies:

The way to decide on what products we will build is to see whether we ourselves like the product; if we like it, our customers will like it.
The only way to build a successful business is to invest no more than 5 percent of your own money in it.
The customer is the key to our success, so we must be totally dedicated to total customer service.

In terms of problems of internal integration the following examples apply:

Ideas can come from anywhere in this organization, so we must maintain a climate of total openness.
The only way to manage a growing business is to supervise every detail on a daily basis.
The only way to manage a growing business is to hire good people, give them clear responsibility, tell them how they will be measured, and then leave them alone.

Several points should be noted about the definition and the examples. First, culture is not the overt behavior or visible artifacts one might observe on a visit to the company. It is not even the philosophy or value system that the founder may articulate or write down in various “charters.” Rather, it is the assumptions that underlie the values and determine not only behavior patterns, but also such visible artifacts as architecture, office layout, dress codes, and so on. This distinction is important because founders bring many of these assumptions with them when the organization begins; their problem is how to articulate, teach, embed, and in other ways get their own assumptions across and working in the system.

Founders often start with a theory of how to succeed; they have a cultural paradigm in their heads, based on their experience in the culture in which they grew up. In the case of a founding group, the theory and paradigm arise from the way that group reaches consensus on their assumptions about how to view things. Here, the evolution of the culture is a multistage process reflecting the
several stages of group formation. The ultimate organizational culture will always reflect the complex interaction between (1) the assumptions and theories that founders bring to the group initially and (2) what the group learns subsequently from its own experiences.

What Is Organizational Culture About?

Any new group has the problem of developing shared assumptions about the nature of the world in which it exists, how to survive in it, and how to manage and integrate internal relationships so that it can operate effectively and make life livable and comfortable for its members. These external and internal problems can be categorized as shown in Figure 1.

The external and internal problems are always intertwined and acting simultaneously. A group cannot solve its external survival problem without being integrated to some degree to permit concerted action, and it cannot

Figure 1. External and Internal Problems

Problems of External Adaptation and Survival

1. Developing consensus on the primary task, core mission, or manifest and latent functions of the group—for example, strategy.
2. Consensus on goals, such goals being the concrete reflection of the core mission.
3. Developing consensus on the means to be used in accomplishing the goals—for example, division of labor, organization structure, reward system, and so forth.
4. Developing consensus on the criteria to be used in measuring how well the group is doing against its goals and targets—for example, information and control systems.
5. Developing consensus on remedial or repair strategies as needed when the group is not accomplishing its goals.

Problems of Internal Integration

1. Common language and conceptual categories. If members cannot communicate with and understand each other, a group is impossible by definition.
2. Consensus on group boundaries and criteria for inclusion and exclusion. One of the most important areas of culture is the shared consensus on who is in, who is out, and by what criteria one determines membership.
3. Consensus on criteria for the allocation of power and status. Every organization must work out its pecking order and its rules for how one gets, maintains, and loses power. This area of consensus is crucial in helping members manage their own feelings of aggression.
4. Consensus on criteria for intimacy, friendship, and love. Every organization must work out its rules of the game for peer relationships, for relationships between the sexes, and for the manner in which openness and intimacy are to be handled in the context of managing the organization’s tasks.
5. Consensus on criteria for allocation of rewards and punishments. Every group must know what its heroic and sinful behaviors are; what gets rewarded with property, status, and power; and what gets punished through the withdrawal of rewards and, ultimately, excommunication.
6. Consensus on ideology and “religion.” Every organization, like every society, faces unexplainable events that must be given meaning so that members can respond to them and avoid the anxiety of dealing with the unexplainable and uncontrollable.
integrate itself without some successful task accomplishment vis-à-vis its survival problem or primary task.

The model of organizational culture that then emerges is one of shared solutions to problems that work well enough to begin to be taken for granted—to the point where they drop out of awareness, become unconscious assumptions, and are taught to new members as a reality and as the correct way to view things. If one wants to identify the elements of a given culture, one can go down the list of issues and ask how the group views itself in relation to each of them: what does it see to be its core mission, its goals, the way to accomplish those goals, the measurement systems and procedures it uses, the way it remedies actions, its particular jargon and meaning system, the authority system, peer system, reward system, and ideology? One will find that there is in most cultures a deeper level of assumptions that ties together the various solutions to the various problems, and this deeper level deals with more ultimate questions. The real cultural essence, then, is what members of the organization assume about the issues shown in Figure 2.

In a fairly “mature” culture—that is, in a group that has a long and rich history—one will find that these assumptions are patterned and interrelated into a “cultural paradigm” that is the key to understanding how members of the group view the world. In an organization that is in the process of formation, the paradigm is more likely to be found only in the founder’s head, but it is important to try to decipher it in order to understand the biases or directions in which the founder “pushes” or “pulls” the organization.

**Figure 2. Basic Underlying Assumptions Around Which Cultural Paradigms Form**

1. The organization's relationship to its environment. Reflecting even more basic assumptions about the relationship of humanity to nature, one can assess whether the key members of the organization view the relationship as one of dominance, submission, harmonizing, finding an appropriate niche, and so on.

2. The nature of reality and truth. Here are the linguistic and behavioral rules that define what is real and what is not, what is a “fact,” how truth is ultimately to be determined, and whether truth is “revealed” or “discovered”; basic concepts of time as linear or cyclical, monochronic or polychronic; basic concepts such as space as limited or infinite and property as communal or individual; and so forth.

3. The nature of human nature. What does it mean to be “human,” and what attributes are considered intrinsic or ultimate? Is human nature good, evil, or neutral? Are human beings perfectible or not. Which is better, Theory X or Theory Y?

4. The nature of human activity. What is the “right” thing for humans to do, on the basis of the above assumptions about reality, the environment, and human nature; to be active, passive, self-developmental, fatalistic, or what? What is work and what is play?

5. The nature of human relationships. What is considered to be the “right” way for people to relate to each other, to distribute power and love? Is life cooperative or competitive: individualistic, group collaborative, or communal; based on traditional lineal authority, law, or charisma; or what?
How Do Organizational Cultures Begin?
The Role of the Founder

Groups and organizations do not form accidentally or spontaneously. They are usually created because someone takes a leadership role in seeing how the concerted action of a number of people could accomplish something that would be impossible through individual action alone. In the case of social movements or new religions, we have prophets, messiahs, and other kinds of charismatic leaders. Political groups or movements are started by leaders who sell new visions and new solutions. Firms are created by entrepreneurs who have a vision of how a concerted effort could create a new product or service in the marketplace. The process of culture formation in the organization begins with the founding of the group. How does this happen?

In any given firm the history will be somewhat different, but the essential steps are functionally equivalent:

1. A single person (founder) has an idea for a new enterprise.
2. A founding group is created on the basis of initial consensus that the idea is a good one, workable and worth running some risks for.
3. The founding group begins to act in concert to create the organization by raising funds, obtaining patents, incorporating, and so forth.
4. Others are brought into the group according to what the founder or founding group considers necessary, and the group begins to function, developing its own history.

In this process the founder will have a major impact on how the group solves its external survival and internal integration problems. Because the founder had the original idea, he or she will typically have biases on how to get the idea fulfilled—biases based on previous cultural experiences and personality traits. In my observation, entrepreneurs are very strong minded about what to do and how to do it. Typically they already have strong assumptions about the nature of the world, the role their organization will play in that world, and the nature of human nature, truth, relationships, time, and space.

Three Examples. Founder A, who built a large chain of supermarkets and department stores, was the dominant ideological force in the company until he died in his seventies. He assumed that his organization could be dominant in the market and that his primary mission was to supply his customers with a quality, reliable product. When A was operating only a corner store with his wife, he built customer relations through a credit policy that displayed trust in the customer, and he always took products back if the customer was not satisfied. Further, he assumed that stores had to be attractive and spotless, and that the only way to ensure this was by close personal supervision. He would frequently show up at all his stores to check into small details. Since he assumed that only close supervision would teach subordinates the right skills,
he expected all his store managers to be very visible and very much on top of their jobs.

As theory about how to grow and win against his competition was to be innovative, so he encouraged his managers to try new approaches, to bring in consulting help, to engage in extensive training, and to feel free to experiment with new technologies. His view of truth and reality was to find it wherever one could and, therefore, to be open to one's environment and never take it for granted that one had all the answers. If new things worked, A encouraged their adoption.

Measuring results and fixing problems was, for A, an intensely personal matter. In addition to using traditional business measures, he went to the stores and, if he saw things not to his liking, immediately insisted that they be corrected. He trusted managers who operated on the basis of similar kinds of assumptions and clearly had favorites to whom he delegated more.

Authority in this organization remained very centralized; the ultimate source of power, the voting shares of stock, remained entirely in the family. A was interested in developing good managers throughout the organization, but he never assumed that sharing ownership through some kind of stock option plan would help in that process. In fact, he did not even share ownership with several key "lieutenants" who had been with the company through most of its life but were not in the family. They were well paid, but received no stock. As a result, peer relationships were officially defined as competitive. A liked managers to compete for slots and felt free to get rid of "losers."

A also introduced into the firm a number of family members who received favored treatment in the form of good developmental jobs that would test them for ultimate management potential. As the firm diversified, family members were made division heads even though they often had relatively little general management experience. Thus peer relationships were highly politicized. One had to know how to stay in favor, how to deal with family members, and how to maintain trust with nonfamily peers in the highly competitive environment.

A wanted open communication and high trust levels, but his own assumptions about the role of the family, the effect of ownership, and the correct way to manage were, to some degree, in conflict with each other, leading many of the members of the organization to deal with the conflicting signals by banding together to form a kind of counterculture within the founding culture. They were more loyal to each other than to the company.

Without going into further detail, I want to note several points about the "formation" of this organization and its emerging culture. By definition, something can become part of the culture only if it works. As theory and assumptions about how things "should be" worked, since his company grew and prospered. He personally received a great deal of reinforcement for his own assumptions, which undoubtedly gave him increased confidence that he had a correct view of the world. Throughout his lifetime he steadfastly adhered to the principles with which he started, and did everything in his power to get
others to accept them as well. At the same time, however, A had to share con-
cepts and assumptions with a great many other people. So as his company
grew and learned from its own experience, A’s assumptions gradually had to
be modified, or A had to withdraw from certain areas of running the business.
For example, in their diversification efforts, the management bought several
production units that would permit backward integration in a number of
areas—but, because they recognized that they knew little about running fac-
tories, they brought in fairly strong, autonomous managers and left them alone.
A also had to learn that his assumptions did not always lead to clear sig-
als. He thought he was adequately rewarding his best young general man-
agers, but could not see that for some of them the political climate, the absence
of stock options, and the arbitrary rewarding of family members made their
own career progress too uncertain. Consequently, some of his best people left
the company—a phenomenon that left A perplexed but unwilling to change
his own assumptions in this area. As the company matured, many of these con-
flicts remained and many subcultures formed around groups of younger man-
agers who were functionally or geographically insulated from the founder.

Founder B built a chain of financial service organizations using sophisti-
cated financial analysis techniques in an urban area where insurance compa-
nies, mutual funds, and banks were only beginning to use these techniques.
He was the conceptualizer and the salesman in putting together the ideas for
these new organizations, but he put only a small percentage of the money up
himself, working from a theory that if he could not convince investors that
there was a market, then the idea was not sound. His initial assumption was
that he did not know enough about the market to gamble with his own
money—an assumption based on experience, according to a story he told
about the one enterprise in which he had failed miserably. With this enterprise,
he had trusted his own judgment on what customers would want, only to be
proven totally wrong the hard way.

B did not want to invest himself heavily in his organizations, either finan-
cially or personally. Once he had put together a package, he tried to find peo-
ple whom he trusted to administer it. These were usually people who, like
himself, were fairly open in their approach to business and not too hung up
on previous assumptions about how things should be done. One can infer that
B’s assumptions about concrete goals, the means to be used to achieve them,
measurement criteria, and repair strategies were pragmatic: Have a clear con-
cept of the mission, test it by selling it to investors, bring in good people who
understand what the mission is, and then leave them alone to implement and
run the organization, using only ultimate financial performance as a criterion.

B’s assumptions about how to integrate a group were, in a sense, irrelevant
since he did not inject himself very much into any of his enterprises. To deter-
mine the cultures of those enterprises, one had to study the managers put into
key positions by B—matters that varied dramatically from one enterprise to
the next. This short example illustrates that there is nothing automatic about
an entrepreneur's process of inserting personal vision or style into his or her organization. The process depends very much on whether and how much that person wants to impose himself or herself.

Founder C, like A, was a much more dominant personality with a clear idea of how things should be. He and four others founded a manufacturing concern several years ago, one based on the founder's product idea along with a strong intuition that the market was ready for such a product. In this case, the founding group got together because they shared a concept of the core mission, but they found after a few years that the different members held very different assumptions about how to build an organization. These differences were sufficient to split the group apart and leave C in control of the young, rapidly growing company.

C held strong assumptions about the nature of the world—how one discovers truth and solves problems—and they were reflected in his management style. He believed that good ideas could come from any source; in particular, he believed that he himself was not wise enough to know what was true and right, but that if he heard an intelligent group of people debate an idea and examine it from all sides, he could judge accurately whether it was sound or not. He also knew that he could solve problems best in a group where many ideas were batted around and where there was a high level of mutual confrontation around those ideas. Ideas came from individuals, but the testing of ideas had to be done in a group.

C also believed very strongly that even if he knew what the correct course of action was, unless the parties whose support was critical to implementation were completely sold on the idea, they would either misunderstand or unwittingly sabotage the idea. Therefore, on any important decision, C insisted on a wide debate, many group meetings, and selling the idea down and laterally in the organization; only when it appeared that everyone understood and was committed would he agree to going ahead. C felt so strongly about this that he often held up important decisions even when he personally was already convinced of the course of action to take. He said that he did not want to be out there leading all by himself if he could not count on support from the troops; he cited past cases in which, thinking he had group support, he made a decision and, when it failed, found his key subordinates claiming that he had been alone in the decision. These experiences, he said, taught him to ensure commitment before going ahead on anything, even if doing so was time-consuming and frustrating.

While C's assumptions about how to make decisions led to a very group-oriented organization, his theory about how to manage led to a strong individualization process. C was convinced that the only way to manage was to give clear and simple individual responsibility and then to measure the person strictly on those responsibilities. Groups could help make decisions and obtain commitment, but they could not under any circumstance be responsible or accountable. So once a decision was made, it had to be carried out by indi-
The Role of the Founder in Creating Organizational Culture

Individuals; if the decision was complex, involving a reorganization of functions, C always insisted that the new organization had to be clear and simple enough to permit the assignment of individual accountabilities.

C believed completely in a proactive model of man and in man's capacity to master nature; hence he expected of his subordinates that they would always be on top of their jobs. If a budget had been negotiated for a year, and if after three months the subordinate recognized that he would overrun the budget, C insisted that the subordinate make a clear decision either to find a way to stay within the budget or to renegotiate a larger budget. It was not acceptable to allow the overrun to occur without informing others and renegotiating, and it was not acceptable to be ignorant of the likelihood that there would be an overrun. The correct way to behave was always to know what was happening, always to be responsible for what was happening, and always to feel free to renegotiate previous agreements if they no longer made sense. C believed completely in open communications and the ability of people to reach reasonable decisions and compromises if they confronted their problems, figured out what they wanted to do, were willing to marshal arguments for their solution, and scrupulously honored any commitments they made.

On the interpersonal level, C assumed "constructive intent" on the part of all members of the organization, a kind of rational loyalty to organizational goals and to shared commitments. This did not prevent people from competitively trying to get ahead—but playing politics, hiding information, blaming others, or failing to cooperate on agreed-upon plans were defined as sins. However, C's assumptions about the nature of truth and the need for every individual to keep thinking out what he or she thought was the correct thing to do in any given situation led to frequent interpersonal tension. In other words, the rule of honoring commitments and following through on consensually reached decisions was superseded by the rule of doing only what you believed sincerely to be the best thing to do in any given situation. Ideally, there would be time to challenge the original decision and renegotiate, but in practice time pressure was such that the subordinate, in doing what was believed to be best, often had to be insubordinate. Thus people in the organization frequently complained that decisions did not "stick," yet had to acknowledge that the reason they did not stick was that the assumption that one had to do the correct thing was even more important. Subordinates learned that insubordination was much less likely to be punished than doing something that the person knew to be wrong or stupid.

C clearly believed in the necessity of organization and hierarchy, but he did not trust the authority of position nearly so much as the authority of reason. Hence bosses were granted authority only to the extent that they could sell their decisions; as indicated above, insubordination was not only tolerated, but actively rewarded if it led to better outcomes. One could infer from watching this organization that it thrived on intelligent, assertive, individualistic people—and, indeed, the hiring policies reflected this bias.
So, over the years, the organization C headed had a tendency to hire and keep the people who fit into the kind of management system I am describing. And those people who fit the founder's assumptions found themselves feeling increasingly like family members in that strong bonds of mutual support grew up among them, with C functioning symbolically as a kind of benign but demanding father figure. These familial feelings were very important, though quite implicit, because they gave subordinates a feeling of security that was needed to challenge each other and C when a course of action did not make sense.

The architecture and office layout in C's company reflected his assumptions about problem solving and human relationships. He insisted on open office landscaping; minimum status differentiation in terms of office size, location, and furnishings (in fact, people were free to decorate their offices any way they liked); open cafeterias instead of executive dining rooms; informal dress codes; first-come, first-serve systems for getting parking spaces; many conference rooms with attached kitchens to facilitate meetings and to keep people interacting with each other instead of going off for meals; and so forth.

In summary, C represents a case of an entrepreneur with a clear set of assumptions about how things should be, both in terms of the formal business arrangements and in terms of internal relationships in the organization—and these assumptions still reflect themselves clearly in the organization some years later.

Let us turn next to the question of how a strong founder goes about embedding his assumptions in the organization.

**How Are Cultural Elements Embedded?**

The basic process of embedding a cultural element—a given belief or assumption—is a "teaching" process, but not necessarily an explicit one. The basic model of culture formation, it will be remembered, is that someone must propose a solution to a problem the group faces. Only if the group shares the perception that the solution is working will that element be adopted, and only if it continues to work will it come to be taken for granted and taught to newcomers. It goes without saying, therefore, that only elements that solve group problems will survive, but the previous issue of "embedding" is how a founder or leader gets the group to do things in a certain way in the first place, so that the question of whether it will work can be settled. In other words, embedding a cultural element in this context meant only that the founder/leader has ways of getting the group to try out certain responses. There is no guarantee that those responses will, in fact, succeed in solving the group's ultimate problem. How do founder/leaders do this? I will describe a number of mechanisms ranging from very explicit teaching to very implicit messages of which even the founder may be unaware. These mechanisms are shown in Figure 3.
The Role of the Founder in Creating Organizational Culture

Figure 3. How Is Culture Embedded and Transmitted?

Each of the mechanisms listed below is used by founders and key leaders to embed a value or assumption they hold, though the message may be very implicit in the sense that the leader is not aware of sending it. Leaders also may be conflicted, which leads to conflicting messages. A given mechanism may convey the message very explicitly, ambiguously, or totally implicitly. The mechanisms are listed below from more or less explicit to more or less implicit ones.

1. Formal statements of organizational philosophy, charters, creeds, materials used for recruitment and selection, and socialization.
2. Design of physical spaces, facades, and buildings.
3. Deliberate role modeling, teaching, and coaching by leaders.
4. Explicit reward and status system and promotion criteria.
5. Stories, legends, myths, and parables about key people and events.
6. What leaders pay attention to, measure, and control.
7. Leader reactions to critical incidents and organizational crises (times when organizational survival is threatened, norms are unclear or are challenged, insubordination occurs, threatening or meaningless events occur, and so forth).
8. How the organization is designed and structured. (The design of work, who reports to whom, degree of decentralization, functional or other criteria for differentiation, and mechanisms used for integration carry implicit messages of what leaders assume and value.)
9. Organizational systems and procedures. (The types of information, control, and decision support systems in terms of categories of information, time cycles, who gets what information, and when and how performance appraisal and other review processes are conducted carry implicit messages of what leaders assume and value.)
10. Criteria used for recruitment, selection, promotion, leveling off, retirement, and "excommunication" of people (the implicit and possibly unconscious criteria that leaders use to determine who "fits" and who doesn't "fit" membership roles and key slots in the organization).

As the above case examples tried to show, the initial thrust of the messages sent is very much a function of the personality of the founder; some founders deliberately choose to build an organization that reflects their own personal biases, whereas others create the basic organization but then turn it over to subordinates as soon as it has a life of its own. In both cases, the process of culture formation is complicated by the possibility that the founder is "conflicted," in the sense of having in his or her own personality several mutually contradictory assumptions.

The commonest case is probably that of the founder who states a philosophy of delegation but who retains tight control by feeling free to intervene, even in the smallest and most trivial decisions, as A did. Because the owner is granted the "right" to run his or her own company, subordinates will tolerate this kind of contradictory behavior and the organization's culture will develop complex assumptions about how one runs the organization "in spite of" or "around" the founder. If the founder's conflicts are severe to the point of interfering with the running of the organization, buffering layers of management may be built in or, in the extreme, the board of directors may have to find a way to move the founder out altogether.
The mechanisms listed in Figure 3 are not equally potent in practice, but they can reinforce each other to make the total message more potent than individual components. In my observation the most important or potent messages are role modeling by leaders (item 3), what leaders pay attention to (item 6), and leader reactions to critical events (item 7). Only if we observe these leader actions can we begin to decipher how members of the organization "learned" the right and proper things to do, and what model of reality they were to adopt.

To give a few examples, A demonstrated his need to be involved in everything at a detailed level by frequent visits to stores and detailed inspections of what was going on in them. When he went on vacation, he called the office every single day at a set time and wanted to know in great detail what was going on. This behavior persisted into his period of semiretirement, when he would still call daily from his retirement home, where he spent three winter months.

A's loyalty to his family was quite evident: he ignored bad business results if a family member was responsible, yet punished a non–family member involved in such results. If the family member was seriously damaging the business, A put a competent manager in under him but did not always give that manager credit for subsequent good results. If things continued to go badly, A would finally remove the family member, but always with elaborate rationalizations to protect the family image. If challenged on this kind of blind loyalty, A would assert that owners had certain rights that could not be challenged. Insubordination from a family member was tolerated and excused, but the same kind of insubordination from a non–family member was severely punished.

In complete contrast, B tried to find competent general managers and turn a business over to them as quickly as he could. He involved himself only if he absolutely had to in order to save the business, and he pulled out of businesses as soon as they were stable and successful. B separated his family life completely from his business and had no assumptions about the rights of a family in a business. He wanted a good financial return so that he could make his family economically secure, but he seemed not to want his family involved in the businesses.

C, like B, was not interested in building the business on behalf of the family; his preoccupation with making sound decisions overrode all other concerns. Hence C set out to find the right kinds of managers and then "trained" them through the manner in which he reacted to situations. If managers displayed ignorance or lack of control of an area for which they were responsible, C would get publicly angry at them and accuse them of incompetence. If managers overran a budget or had too much inventory and did not inform C when this was first noticed, they would be publicly chided, whatever the reason was for the condition. If the manager tried to defend the situation by noting that it developed because of actions in another part of the same company, actions which C and others had agreed to, C would point out strongly that the manager should have brought that issue up much earlier and forced a rethinking or renegotiation right away. Thus C made it clear through his reactions that
poor ultimate results could be excused, but not being on top of one's situation could never be excused.

C taught subordinates his theory about building commitment to a decision by systematically refusing to go along with something until he felt the commitment was there, and by punishing managers who acted impulsively or prematurely in areas where the support of others was critical. He thus set up a very complex situation for his subordinates by demanding on the one hand a strong individualistic orientation (embodied in official company creeds and public relations literature) and, on the other, strong rules of consensus and mutual commitment (embodied in organizational stories, the organization's design, and many of its systems and procedures).

The above examples highlighted the differences among the three founders to show the biases and unique features of the culture in their respective companies, but there were some common elements as well that need to be mentioned. All three founders assumed that the success of their business(es) hinged on meeting customer needs; their most severe outbursts at subordinates occurred when they learned that a customer had not been well treated. All of the official messages highlighted customer concern, and the reward and control systems focused heavily on such concerns. In the case of A, customer needs were even put ahead of the needs of the family; one way a family member could really get into trouble was to mess up a customer relationship.

All three founders, obsessed with product quality, had a hard time seeing how some of their own managerial demands could undermine quality by forcing compromises. This point is important because in all the official messages, commitment to customers and product quality were uniformly emphasized—making one assume that this value was a clear priority. It was only when one looked at the inner workings of A's and C's organizations that one could see that other assumptions that they held created internal conflicts that were difficult to overcome—conflicts that introduced new cultural themes into the organization.

In C's organization, for example, there was simultaneously a concern for customers and an arrogance toward customers. Many of the engineers involved in the original product designs had been successful in estimating what customers would really want—a success leading to their assumption that they understood customers well enough to continue to make product designs without having to pay too much attention to what sales and marketing were trying to tell them. C officially supported marketing as a concept, but his underlying assumption was similar to that of his engineers, that he really understood what his customers wanted; this led to a systematic ignoring of some inputs from sales and marketing.

As the company's operating environment changed, old assumptions about the company's role in that environment were no longer working. But neither C nor many of his original group had a paradigm that was clearly workable in the new situation, so a period of painful conflict and new learning arose. More and more customers and marketing people began to complain, yet some parts
of the organization literally could not hear or deal with these complaints because of their belief in the superiority of their products and their own previous assumptions that they knew what customers wanted.

In summary, the mechanisms shown in Figure 3 represent all of the possible ways in which founder messages are communicated and embedded, but they vary in potency. Indeed, they may often be found to conflict with each other—either because the founder is internally conflicted or because the environment is forcing changes in the original paradigm that lead different parts of the organization to have different assumptions about how to view things. Such conflicts often result because new, strong managers who are not part of the founding group begin to impose their own assumptions and theories. Let us look next at how these people may differ and the implications of such differences.

**Founder/Owner Versus “Professional Managers”**

Distinctive characteristics or “biases” introduced by the founder’s assumptions are found in first-generation firms that are still heavily influenced by founders and in companies that continue to be run by family members. As noted above, such biases give the first-generation firm its distinctive character, and such biases are usually highly valued by first-generation employees because they are associated with the success of the enterprise. As the organization grows, as family members or non-family managers begin to introduce new assumptions, as environmental changes force new responses from the organization, the original assumptions begin to be strained. Employees begin to express concern that some of their “key” values will be lost or that the characteristics that made the company an exciting place to work are gradually disappearing.

Clear distinctions begin to be drawn between the founding family and the “professional” managers who begin to be brought into key positions. Such “professional” managers are usually identified as non-family and as nonowners and, therefore, as less “invested” in the company. Often they have been specifically educated to be managers rather than experts in whatever is the company’s particular product or market. They are perceived, by virtue of these facts, as being less loyal to the original values and assumptions that guided the company, and as being more concerned with short-run financial performance. They are typically welcomed for bringing in much-needed organizational and functional skills, but they are often mistrusted because they are not loyal to the founding assumptions.

Although these perceptions have strong stereotypic components, it is possible to see that much of the stereotype is firmly based in reality if one examines a number of first-generation and family-owned companies. Founders and owners do have distinctive characteristics that derive partly from their personalities and partly from their structural position as owners. It is important to understand these characteristics if one is to explain how strongly held many of the values and assumptions of first-generation or family-owned companies are. Table 1 examines the “stereotype” by polarizing the founder/owner and
Table 1. How Do Founder/Owners Differ from “Professional Managers”?

“professional” manager along a number of motivational, analytical, interpersonal, and structural dimensions.

The main thrust of the differences noted is that the founder/owner is seen as being more self-oriented, more willing to take risks and pursue noneconomic objectives, and, by virtue of being the founder/owner, more able to take risks and to pursue such objectives. Founder/owners are more often intuitive and holistic in their thinking, and they are able to take a long-range point of view because they are building their own identities through their enterprises. They are often more particularistic in their orientation, a characteristic that results in the building of more of a community in the early organizational stages. That is, the initial founding group and the first generation of employees will know each other well and will operate more on personal acquaintance and trust than on formal principles, job descriptions, and rules.

The environment will often be more political than bureaucratic, and founder-value biases will be staunchly defended because they will form the basis for the group's initial identity. New members who don't fit this set of assumptions and values are likely to leave because they will be uncomfortable, or they will be ejected because their failure to confirm accepted patterns is seen as disruptive.

Founder/owners, by virtue of their position and personality, also tend to fulfill some unique functions in the early history of their organizations:

1. Containing and absorbing anxiety and risk. Because they are positionally more secure and personally more confident, owners more than managers absorb and contain the anxieties and risks that are inherent in creating, developing, and enlarging an organization. Thus in times of stress, owners play a special role in reassuring the organization that it will survive. They are the stakeholders; hence they do have the ultimate risk.

2. Embedding noneconomic assumptions and values. Because of their willingness to absorb risk and their position as primary stakeholders, founder/owners are in a position to insist on doing things that may not be optimally efficient from a short-run point of view, but that reflect their own values and biases on how to build an effective organization and/or how to maximize the benefits to themselves and their families. Thus founder/owners often start with humanistic and social concerns that become reflected in organizational structure and process. Even when "participation," or "no layoffs," or other personnel practices such as putting marginally competent family members into key slots are "inefficient," owners can insist that this is the only way to run the business and make that decision stick in ways that professional managers cannot.

3. Stimulating innovation. Because of their personal orientation and their secure position, owners are uniquely willing and able to try new innovations that are risky, often with no more than an intuition that things will improve. Because managers must document, justify, and plan much more carefully, they have less freedom to innovate.

As the organization ages and the founder becomes less of a personal force, there is a trend away from this community feeling toward more of a rational,
The Role of the Founder in Creating Organizational Culture

bureaucratic type of organization dominated by general managers who may care less about the original assumptions and values, and who are not in a position to fulfill the unique functions mentioned above. This trend is often feared and lamented by first- and second-generation employees. If the founder introduces his or her own family into the organization, and if the family assumptions and values perpetuate those of the founder, the original community feeling may be successfully perpetuated. The original culture may then survive. But at some point there will be a complete transition to general management, and at that point it is not clear whether the founding assumptions survive, are metamorphosed into a new hybrid, or are displaced entirely by other assumptions more congruent with what general managers as an occupational group bring with them.

4. Originating evolution through hybridization. The founder is able to impose his or her assumptions on the first-generation employees, but these employees will, as they move up in the organization and become experienced managers, develop a range of new assumptions based on their own experience. These new assumptions will be congruent with some of the core assumptions of the original cultural paradigm, but will add new elements learned from experience. Some of these new elements or new assumptions will solve problems better than the original ones because external and internal problems will have changed as the organization matured and grew. The founder often recognizes that these new assumptions are better solutions, and will delegate increasing amounts of authority to those managers who are the best “hybrids”: those who maintain key old assumptions yet add relevant new ones.

The best example of such hybrid evolution comes from a company that was founded by a very free-wheeling, intuitive, pragmatic entrepreneur: D, who, like C in the example above, believed strongly in individual creativity; a high degree of decentralization; high autonomy for each organizational unit; high internal competition for resources; and self-control mechanisms rather than tight, centralized organizational controls. As this company grew and prospered, coordinating so many autonomous units became increasingly difficult, and the frustration that resulted from internal competition made it increasingly expensive to maintain this form of organization.

Some managers in this company, notably those coming out of manufacturing, had always operated in a more disciplined, centralized manner—without, however, disagreeing with core assumptions about the need to maximize individual autonomy. But they had learned that in order to do certain kinds of manufacturing tasks, one had to impose some discipline and tight controls. As the price of autonomy and decentralization increased, D began to look increasingly to these manufacturing managers as potential occupants of key general management positions. Whether he was conscious of it or not, what he needed was senior general managers who still believed in the old system but who had, in addition, a new set of assumptions about how to run things that were more in line with what the organization now needed. Some of the first-generation managers were quite nervous at seeing what they considered to be their “hardnosed”
colleagues groomed as heirs apparent. Yet they were relieved that these potential successors were part of the original group rather than complete outsiders.

From a theoretical standpoint, evolution through hybrids is probably the only model of culture change that can work, because the original culture is based so heavily on community assumptions and values. Outsiders coming into such a community with new assumptions are likely to find the culture too strong to budge so they either give up in frustration or find themselves ejected by the organization as being too foreign in orientation. What makes this scenario especially likely is the fact that the distinctive parts of the founding culture are often based on biases that are not economically justifiable in the short run.

As noted earlier, founders are especially likely to introduce humanistic, social service, and other noneconomic assumptions into their paradigm of how an organization should look, and the general manager who is introduced from the outside often finds these assumptions to be the very thing that he or she wants to change in the attempt to “rationalize” the organization and make it more efficient. Indeed, that is often the reason the outsider is brought in. But if the current owners do not recognize the positive functions their culture plays, they run the risk of throwing out the baby with the bath water or, if the culture is strong, wasting their time because the outsider will not be able to change things anyway.

The ultimate dilemma for the first-generation organization with a strong founder-generated culture is how to make the transition to subsequent generations in such a manner that the organization remains adaptive to its changing external environment without destroying cultural elements that have given it its uniqueness, and that have made life fulfilling in the internal environment. Such a transition cannot be made effectively if the succession problem is seen only in power or political terms. The thrust of this analysis is that the culture must be analyzed and understood, and that the founder/owners must have sufficient insight into their own culture to make an intelligent transition process possible.

Earlier work along these lines has been incorporated into my book Career Dynamics (Addison-Wesley, 1978). Further explication of the ideas of an organizational culture can be found in Andrew M. Pettigrew’s article “On Studying Organizational Cultures” (Administrative Science Quarterly, December 1979), Meryl Louis’s article “A Cultural Perspective on Organizations” (Human Systems Management, 1981, 2, 246-258), and in H. Schwartz and S. M. Davis’s “Matching Corporate Culture and Business Strategy” (Organizational Dynamics, Summer 1981).

The specific model of culture that I use was first published in my article “Does Japanese Management Style Have a Message for American Managers?” (Sloan Management Review, Fall 1981) and is currently being elaborated into a book on organizational culture.
